

As a kid, I vividly remember my first experience on a computer; it was like discovering magic, where my inputs and movements were able to manifest into an action on the screen in front of me. This seemingly insignificant moment would go on to completely change my life, as I became obsessed with computer science and the endless capabilities that could result from programming.

Software development is more than just problem solving -- it is an art. It is complex, it requires a lot of effort and thought, and it is remarkably beautiful when done right. I am continuously amazed at the progress engineers have made in the world of computer science, and my goal is to contribute to this space in whatever capacity I am able to.

As a professional, I am full-stack software developer with about 3 years of experience. I graduated from Cal Poly SLO and have done two internships with GoDaddy in Seattle, before moving and working full-time in their San Francisco office. Examples of technologies I've touched include: React, Node, C#, SQL, Cypress (end-to-end Testing), MongoDB, Mixpanel (and a lot of A/B testing flows).

There are two things that excite me most, and they go hand in hand: producing excellent results, with amazing people. I take my work very seriously, and I ensure that the quality of my work is accompanied by my work ethic. I believe that the best results are produced on the basis of passion and curiosity. But perhaps most importantly, it is about the people. Culture matters a lot to me, and I want to work in a place where I am able to develop strong relationships. Nothing gets me going more than drawing from the spirit of others, and in turn, I hope to inspire others as well.

Thank you for your time and consideration,

Yeng Tan
